

# Limits of Assignment Project Exam Help Computation

---

<https://powcoder.com>

II - Church-Turing Thesis  
Add WeChat powcoder  
Bernhard Reus

# The story so far

- We have found problems that cannot be solved by a WHILE program (*Halting, Busy-Beaver, Tiling, Ambiguity of CFGs*, etc).  
<https://powcoder.com>
- But this does not mean yet they could not be solved by a different machine model (different definition of “effective procedure”).

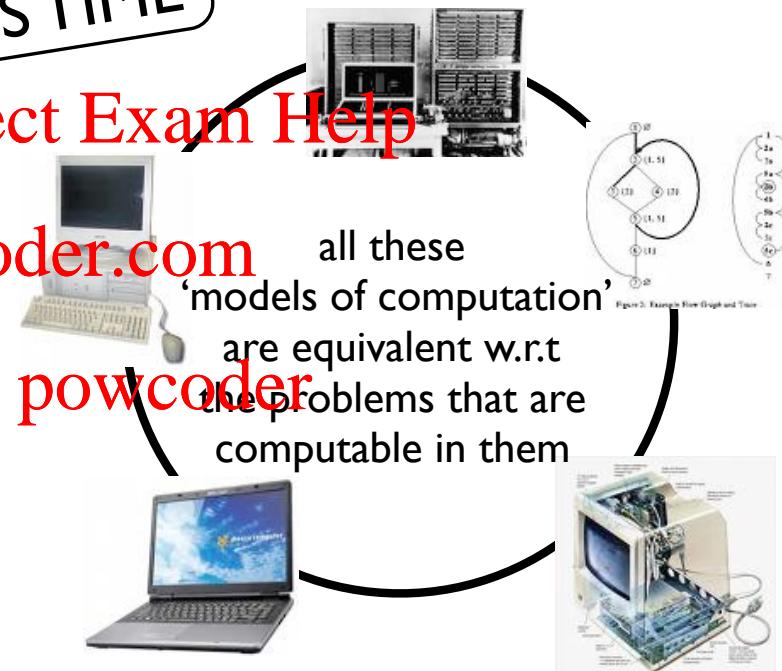

# More ‘notions of computation’

- Evidence for the
  - Church-Turing Thesis
- by looking at other notions of computation: <https://powcoder.com>
  - Register machines
  - Counter machines
  - Turing machines
  - Goto language
  - Cellular Automata
- and showing (or stating) that they are all equivalent.

THIS TIME

Assignment Project Exam Help

# Church-Turing Thesis

reasonable formalisations of the intuitive notion of effective computability

All reasonable computation models are equivalent.

[Assignment Project Exam Help](https://powcoder.com)

no restrictions on memory size and execution time are assumed

So it does not matter what model we use.  
It was alright to use WHILE.

We cannot prove this as it refers to informal entities (reasonable computation models). It is thus only a “thesis”. But we provide some evidence for it.

# Models of computation

- Random Access Machines (register machines): RAM
- Turing machines: TM [Assignment](#) [Project](#) [Exam](#) [Help](#)
- Counter machines: CM <https://powcoder.com>
- Flowchart language: COTO [Add WeChat](#) [powcoder](#)
- Cellular Automata: CA
- While language: WHILE ✓
- Church's  $\lambda$ -Calculus (see course *Comparative Prog. Languages*)

# Machine instructions

- TM, GOTO, CM, RAM have the following in common:  
**Assignment Project Exam Help**
- A program is a sequence of instructions with labels  
**<https://powcoder.com>**  
 $I_1:I_1; I_2:I_2; \dots I_n:I_n$
- a state or configuration during execution of the program is of the form  $(I, \sigma)$  where  $I$  is the current instruction's label and  $\sigma$  is the “store” which varies from machine to machine.

WHILE does not have ‘machine flavour’, it’s more abstract

CA quite different

# Semantic Framework for Machines

- definition of store
- function <https://powcoder.com> producing initial store
- function Add WeChat powcoder output
- description of semantics of the instructions,

$$p \vdash s \rightarrow s'$$

program p transits form configuration s into s' in one step

# Semantic Framework for machines

**Definition 11.2 (General framework for machine model semantics).** Let  $p$  be a machine program with  $m$  instructions.

**Assignment Project Exam Help**

$$\llbracket p \rrbracket(d) = e \text{ iff } \sigma_0 = \text{Readin}(d) \quad \text{and} \\ \text{https://powcoder.com} \quad \text{and} \\ \text{IP}^+(d, \sigma_0) \text{ GET}^+(m, \sigma) \quad \text{and} \\ e = \text{Readout}(\sigma)$$

**Add WeChat powcoder**

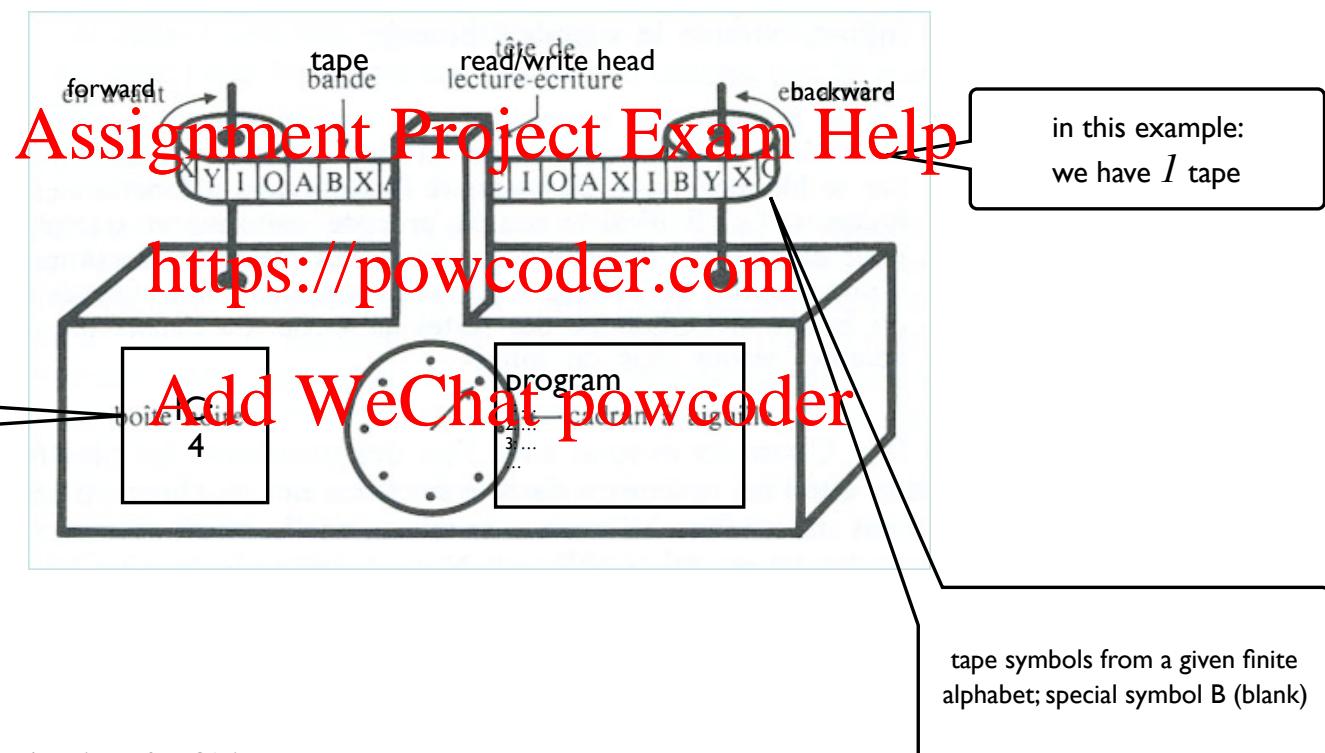

$p \vdash s \rightarrow^* s'$

“many-step” operational semantics for machine language, zero, one, or several steps of the “one-step” semantics

We will now show how semantics of other languages/machines are an instance of this framework.

# Turing Machine

<https://www.youtube.com/watch?v=cYw2ewoO6c4>

# Turing Machine

j is number of tape

presented in a way to fit our machine model

instruction  
 $\text{right}_j$

explanation  
move right

$\text{left}_j$

move left

$\text{write}_j S$

write S

$\text{if}_j S \text{ goto } \ell_1 \text{ else } \ell_2$

conditional jump (read)

## Assignment Project Exam Help

<https://powcoder.com>

Store (= Tapes)

$(L_1 \underline{S_1} R_1, L_2 \underline{S_2} R_2, \dots L_k \underline{S_k} R_k)$

$L_i, R_i$  are strings of symbols

we have  $k$  tapes

$\underline{\phantom{x}}$  denotes position of read/write head

# Turing Machine

Readin (input)

$\text{Readin}(x) = (\underline{B}x, \underline{B}, \underline{B}, \dots, \underline{B})$

Readout (output)

$\text{Readout}(\underline{L}_1\underline{S}_1\underline{R}_1, \underline{L}_2\underline{S}_2\underline{R}_2, \dots, \underline{L}_k\underline{S}_k\underline{R}_k) = \text{Prefix}(\underline{R}_1)$

where  $\text{Prefix}(\underline{R}_1\underline{B}\underline{R}_2) = \underline{R}_1$  provided that  $\underline{R}_1$  does not contain any blank symbols

<https://powcoder.com>

One-step operational semantics for **I-tape** machine (no subscripts)

Add WeChat powcoder

- $p \vdash (\ell, LSS'R) \rightarrow (\ell + 1, LSS'R)$  if  $p(\ell) = \text{right}$
- $p \vdash (\ell, LS) \rightarrow (\ell + 1, LSB)$  if  $p(\ell) = \text{right}$
- $p \vdash (\ell, LS'SR) \rightarrow (\ell + 1, LS'SR)$  if  $p(\ell) = \text{left}$
- $p \vdash (\ell, SR) \rightarrow (\ell + 1, BSR)$  if  $p(\ell) = \text{left}$
- $p \vdash (\ell, LSR) \rightarrow (\ell + 1, LS'R)$  if  $p(\ell) = \text{write } S'$
- $p \vdash (\ell, LSR) \rightarrow (\ell_1, LSR)$  if  $p(\ell) = \text{if } S \text{ goto } \ell_1 \text{ else } \ell_2$
- $p \vdash (\ell, LS'R) \rightarrow (\ell_2, LS'R)$  if  $p(\ell) = \text{if } S \text{ goto } \ell_1 \text{ else } \ell_2 \text{ and } S \neq S'$

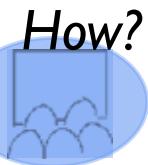

# GOTO

instruction	explanation
X := nil	assign nil
X := Y	assign variable
X := hd Y	assign hd Y
X := tl Y	assign tl Y
X := cons Y Z	assign cons Y Z
if X goto $\ell_1$ else $\ell_2$	conditional jump

Assignment Project Exam Help

<https://powcoder.com>

goto (unconditional jump)  
can be expressed as well

- uses the tree data type we know from WHILE
- does only permit operations on variables
- if X tests whether X is not nil and then jumps according to a label
- store as for WHILE, ReadIn and Readout like WHILE semantics of programs.

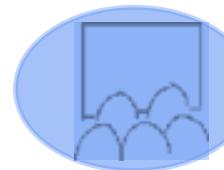

# Sample Program

```
1: if X goto 2 else 6;  
2: Y := hd X;  
3: R := cons Y R;  
4: X := tl X; https://powcoder.com  
5: if R goto 1 else 1;  
6: X := R;
```

Assignment Project Exam Help

GOTO programs not as readable as  
WHILE programs

Add WeChat powcoder

What does it compute?

# Semantics of GOTO

store  $\sigma$  (sigma) where variable X is assigned  
value nil

$\ell$ -th instruction

Assignment Project Exam Help

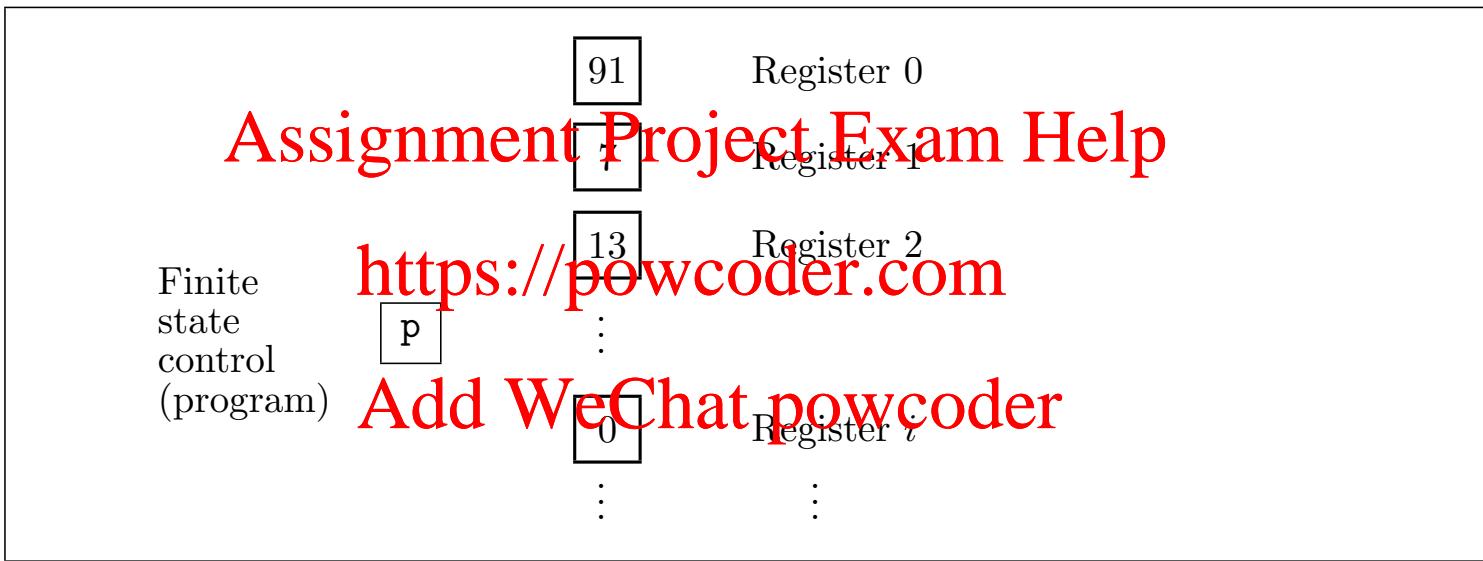

- $p \vdash (\ell, \sigma) \rightarrow (\ell + 1, \sigma[X := \text{nil}]) \quad \text{if } p(\ell) = X := \text{nil}$
- $p \vdash (\ell, \sigma) \rightarrow (\ell + 1, \sigma[X := \sigma(Y)]) \quad \text{if } p(\ell) = X := Y$
- $p \vdash (\ell, \sigma) \rightarrow (\ell + 1, \sigma[X := Y]) \quad \text{if } p(\ell) = X := \text{hd } Y \text{ and } \sigma(Y) = \langle d.e \rangle$
- $p \vdash (\ell, \sigma) \rightarrow (\ell + 1, \sigma[X := \text{nil}]) \quad \text{if } p(\ell) = X := \text{hd } Y \text{ and } \sigma(Y) = \text{nil}$
- $p \vdash (\ell, \sigma) \rightarrow (\ell + 1, \sigma[X := e]) \quad \text{if } p(\ell) = X := \text{t1 } Y \text{ and } \sigma(Y) = \langle d.e \rangle$
- $p \vdash (\ell, \sigma) \rightarrow (\ell + 1, \sigma[X := \text{nil}]) \quad \text{if } p(\ell) = X := \text{t1 } Y \text{ and } \sigma(Y) = \text{nil}$
- $p \vdash (\ell, \sigma) \rightarrow (\ell + 1, \sigma[X := \langle d.e \rangle]) \quad \text{if } p(\ell) = X := \text{cons } Y Z \text{ and } \sigma(Y) = d \text{ and } \sigma(Z) = e$
- $p \vdash (\ell, \sigma) \rightarrow (\ell_1, \sigma) \quad \text{if } p(\ell) = \text{if } X \text{ goto } \ell_1 \text{ else } \ell_2 \text{ and } \sigma(X) \neq \text{nil}$
- $p \vdash (\ell, \sigma) \rightarrow (\ell_2, \sigma) \quad \text{if } p(\ell) = \text{if } X \text{ goto } \ell_1 \text{ else } \ell_2 \text{ and } \sigma(X) = \text{nil}$

Add WeChat powcoder

# RAM model

- uses *arbitrarily many registers containing arbitrarily big numbers.*

# (S)RAM instruction set

S<sub>uccessor</sub> RAM is like RAM but without binary operations

Assignment Project Exam Help

instruction	explanation
$X_i := 0$	reset register value
$X_i := X_i + 1$	increment register value
$X_i := X_i - 1$	decrement register value
$X_i := X_j$	move register value
$X_i := <X_j>$	indirect addressing move content of register addressed by $X_j$
$<X_i> := X_j$	move into register addressed by $X_i$
if $X_i = 0$ goto $\ell_1$ else $\ell_2$	conditional jump
available only in RAM	
$X_i := X_j + X_k$	addition of register values
$X_i := X_j * X_k$	multiplication of register values

Add WeChat powcoder

- data type of *natural numbers*
- angle brackets < > *indirect addressing*
- if-goto-else tests whether  $X$  is 0 and then *jumps accordingly*.

# Semantics SRAM

$\text{SRAM-store} = \{ \sigma \mid \sigma : IN \rightarrow IN \}$

$\text{Readin}(x) = \{0 \rightarrow p_0, 1 \rightarrow p_1, \dots\} \dots$  Input in register X0

$\text{Readout}(\sigma) = \sigma^{(0)}$  From register X0

Assignment Project Exam Help

$p \vdash (\ell, \sigma) \rightarrow (\ell + 1, \sigma[\sigma(i) := \sigma(j)]) \quad \text{if } p(\ell) = <x_i> := x_j$

# Counter Machine CM

I ::=  $X_i := X_i + 1 \mid X_i := X_i - 1 \mid \text{if } X_i = 0 \text{ goto } \ell \text{ else } \ell'$

Assignment Project Exam Help

- Counter machines are much simpler than register machines <https://powcoder.com>
- They contain several registers called *counters* as they can only be incremented or decremented and tested for zero.
- 2CM is like CM but with 2 counters only.
- Semantics as for register machines.

# Cellular Automata CA

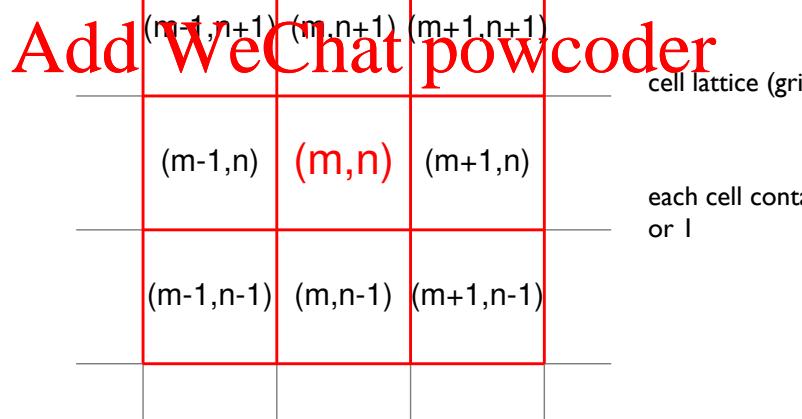

we just focus one specific version the famous 2-dimensional CA called (Conway's) **Game of Life**

Assignment Project Exam Help

neighbourhood of  $(m,n)$   
= 8 cells

the value of a cell changes every  
“time tick” and the new value is  
determined only by the values of  
the neighbourhood cells

<https://powcoder.com>

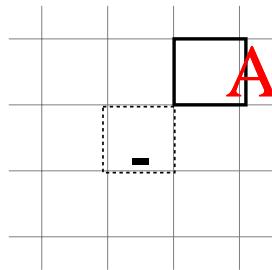

John Conway (Cambridge Mathematician)

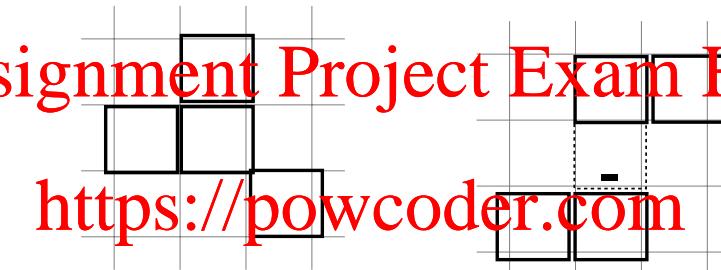

# Rules of Game of Life

alive = 1 (solid line/filled)  
dead = 0 (no colour)

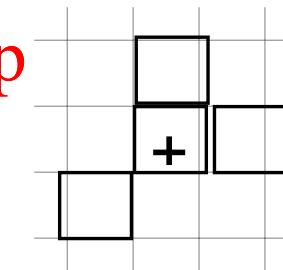

Underpopulation

die if fewer  
than two neighbours  
are alive

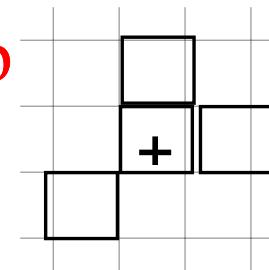

Survival

survive (stay alive) if two or  
three  
neighbours are alive

Overcrowding

die if more  
than three neighbours  
are alive

Reproduction

become alive if exactly three  
neighbours  
are alive

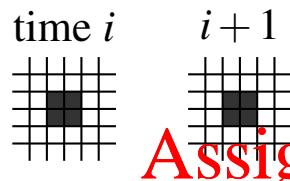

Assignment Project Exam Help

Add WeChat powcoder

# Patterns of Game of Life

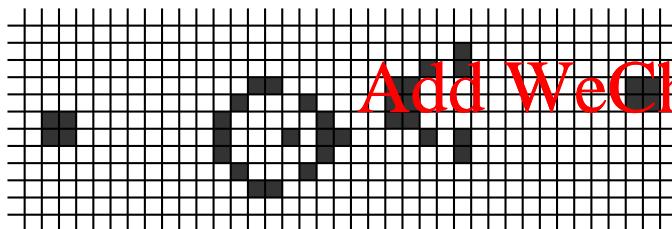

static

<https://www.youtube.com/watch?v=OrCTmfQWCmQ>

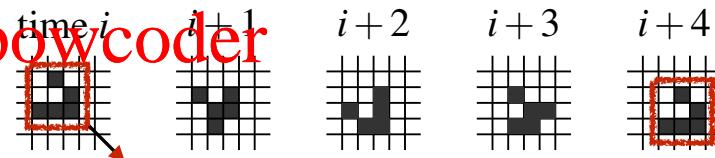

oscillating (dynamic)

<https://powcoder.com>

<https://www.youtube.com/watch?v=GrI05RJ76D0>

productive:  
Gosling's Glider Gun

one-cell diagonal movement  
of glider (dynamic)

# Cellular Automata

- Fun, but can they compute in our sense?
- Yes, one has to:
  - encode input as starting grid
  - result if a predefined cell changes its state to a predefined “accepting state”
  - “accepting state” must be left alone in further grid changes.

**Computability**  
Add WeChat powcoder

Church-Turing Thesis

# Robustness of Computability

- We justify the Church-Turing thesis ...
- ... by showing that all the above notions of computation are equivalent to WHILE.  
<https://powcoder.com>
- Proof technique:
  - compile one program of language X into an equivalent one of language Y ...
  - ... if X is not a sub-language of Y anyway.
  - compose compilers appropriately to avoid having to write  $n^2$  compilers:

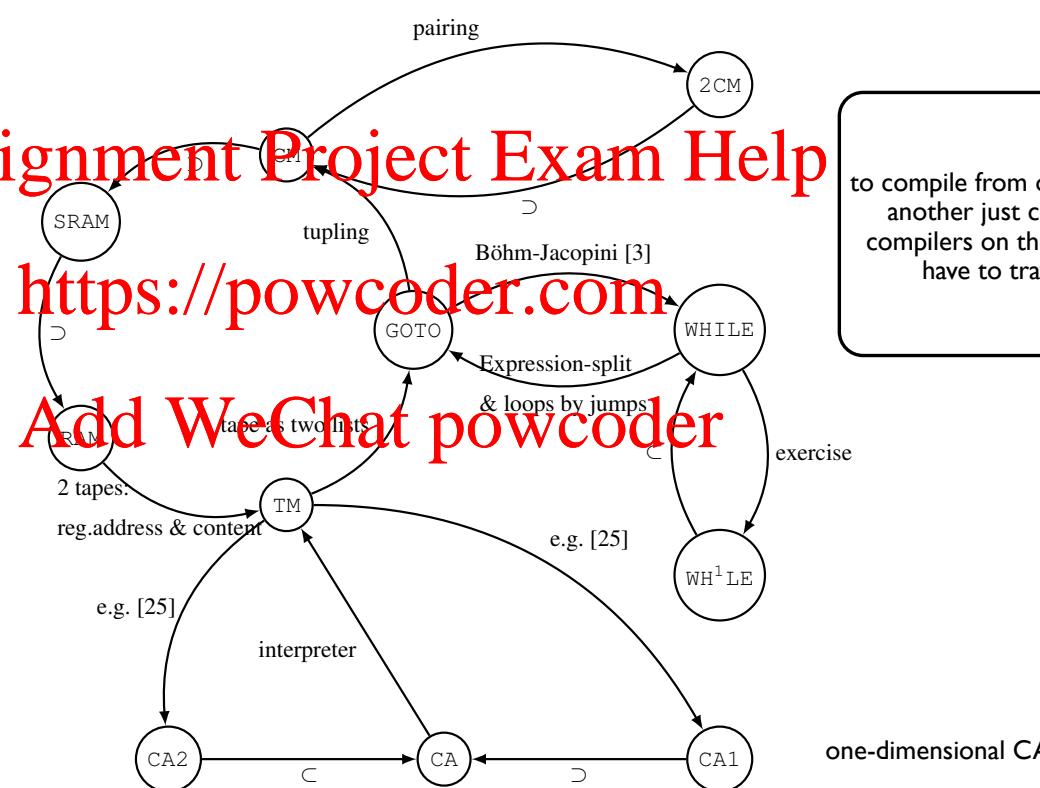

# Diagram of Equivalences

The label of each arrow is either  $\subset$  if one language is included in the other or the name/idea of the required **compilation**.

Details of compilations in N. Jones' book, Chapter 8, exercises.

two-dimensional CA
